

IN CASE OF EMERGENCY

I have type (1, 2) diabetes, and I am taking the SGLT-2 inhibitor drug (Invokana, Farxiga, Jardiance, Invokamet, Xigduo XR, or Glyxambi). The FDA has issued a warning that these drugs may cause diabetic ketoacidosis in the absence of hyperglycemia. If I exhibit the symptoms of a metabolic acidosis without hyperglycemia, it is important to check my ketone levels and understand that I may be experiencing euglycemic diabetic ketoacidosis. For more information, the FDA's issued warning can be found at:
